Black Box testing does not care about the internal structure or the code, but simply tests if a valid output is produced for a valid input. The input for our java program is 2 .csv files. Thus our equivalence partitioning and boundary value analysis will be associated with the input space of 2 .csv files

Use Case: Reading 2 .csv files

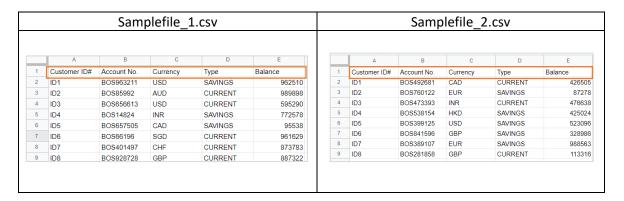

Input Space: 2 .csv files

Equivalence partitioning: Valid Class and Invalid Class

1. Valid Class:

Examples of valid classes:

a. Any 2 .csv files with a column header, same number of columns, same column type, same column order

b. Any 2 .csv files with no column header, same number of columns, same column type, same column order

		Samp	olefile_1.	CSV			Sampl	efile_2.c	SV

Boundary Value & Middle Value of Valid Class

a. Column header:

Boundary Value 1 (Lower Boundary): 2 rows and 2 columns

Samp	lefile_1.csv		Samplefile_2.csv				
Customer ID#	Account No.	Customer	ID# Account No.				
ID1	BOS963211	ID1	BOS492681				

Boundary Value 2 (Upper Boundary): 1001 rows and 5 columns (Example not shown since difficult to paste table with 1001 rows)

Middle Value: [2 <= number of rows <= 1001 and 2 <= number of columns <= 5]

Example: 50 rows, 3 columns

Samplefile_1.csv

2. Invalid Class:

Examples of Invalid classes:

- a. 1 or both files not in .csv format
- b. Empty files (0 rows, 0 columns)
- c. 1 .csv file has a column header, other .csv file does not have column header

		Sam	plefile_1	1.csv					Samplefile_2.csv

Boundary Value & Middle Value of Invalid Class

Boundary Value 1 column, n rows. A file with <1 column will be empty and a file with >1 column will become a valid input.

Samplefile_1.csv	Samplefile_2.csv					
Customer ID#	Customer ID#					

Middle Value: 50 rows, 8 columns. Any more than 5 columns is invalid class.
